1.PATCH OR DOWNLOAD 2.click the download links(saved link for you) 3.that done, all complete 4.Run the files to install 5.Done!

**What is IP address** The IP address of your computer is an identifier, and a way to identify your computer on the network. Every IP address is unique, but not all IP addresses can be used. For example, you cannot take part in network games by using any IP address that you want, you need to get IP address from your ISP

**What is DHCP** A Dynamic Host Configuration Protocol is a computer networking protocol that enables computers to share an IP address and to obtain an address from a DHCP server on the network automatically. The DHCP protocol is a standard protocol of TCP/IP (Transmission Control Protocol/Internet Protocol), is used in common use in every computer network.

**How does the IP address work** In a network, you connect to the Internet with an ISP (Internet Service Provider) through a router and modem. Once connected to the Internet, you get an IP address automatically from the ISP, and this is your home IP address. Your computer is a computer that will access the network and will use an IP address to connect to other computers on the network. 82157476af
